 RMA 800.5
 C920-0032

Thank you for purchasing a Roswell Marine Audio (RMA) Amplifier. Since 1998 Roswell has been the world leader in wakeboard towers and accessories in the marine industry and is quickly becoming a leader in marine audio.

This RMA Marine Amplifier uses a super-efficient Class D topology that significantly improves efficiency while enhancing sound quality. The amplifier has been designed using the latest available electronic technology, allowing you to produce high quality stereo reproduction in mobile applications. This system provides low harmonic distortion, a considerable amount of reserve voltage, and high temperature stability.

#### Installation Instructions

RMA amplifiers are designed for easy installation in your boat. To ensure proper operation of your new investment, please follow the suggestions listed in this manual.

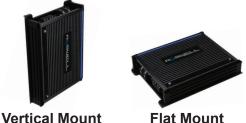

#### Warning

Please check the suitability of the installation location before you begin. Do not cut any of the boat's structure. Pay close attention to what is behind any bulkheads, panels and carpet. Often the boat manufacturer will hide wires and cables in the exact location you may wish to install in. The amplifier is sensitive to electrical and motor noise and interference from the amplifier may affect your radio reception, try mounting the amp at least three feet away from the receiver.

If you do not have experience with automotive or marine electrical and mechanical systems please contact a professional installer. Paying a qualified installer is almost always cheaper than paying a dealership to repair your boat.

#### Location of the Amplifier

The amplifier must be securely mounted to a solid surface. Please select a dry location such as in the storage compartment. Do not mount the amplifier to any area that may have excessive vibration (like the subwoofer box) or under any cup holder drain lines that may leak water. Position the amplifier in an area that receives sufficient airflow and mount it vertically or completely flat for optimal heat dissipation.

#### Supplying Enough Power

Your amplifier converts power, or current, from your boat's electrical system and turns it into high power audio energy. If the amp does not get all the power it needs, it will not produce its full output. If the voltage or current drops too low, the amplifier will drop below it's rated output. Make sure your boats charging system is in good working order. Any hi-performance audio amplifier will increase the demand on your alternator and battery. If you are unsure, have your charging system tested by a professional technician.

**Important:** The performance of your amplifier is reliant on using high quality marine grade wiring components. There are inherent risks when using low-cost wiring materials with a high power amplifier, most critical of which is overheating. A full RMA Wiring Kit (C920-0003) can be purchased separately through an RMA dealer, we highly recommend using our wiring kit as it ensures high quality wiring and fusing.

## The Ground

## Warning: Read the following carefully

The ground wire should be connected directly to the battery of your boat. Remember, the ground must carry the same high current as the positive wire.

To reduce the risk of noise, run all signal cables away from any power supplying wires.

### Running the Cables

Carefully run your power and ground wires to the battery. 4 AWG is the minimum recommended wire size for this amplifier. If powering multiple amplifiers from the same power wire, verify the wire size is adequate for the total amp draw. Roswell recommends using full spec wiring adequate for the total amp draw from the amplifiers being powered. You must install a main fuse within 12" of the battery rated for the total amount of amplifiers used. You must also use an in-line fuse for each amplifier, installing it no further than 18" away from the amplifier (check your particular amplifier model for fuse rating).

#### Level

Due to the wide range of head unit output configurations all RMA amplifiers have an adjustable input sensitivity or "LEVEL" or "GAIN". The level is not a volume control. It properly matches the input of the amplifier to the output of the head unit and makes the amplifier more sensitive to input from the stereo. With the level up, the amplifier will reach maximum output at a lower volume setting on the deck. At higher level settings the amplifier becomes more sensitive to noise from the boats electrical system. Try to run the level at the lowest setting possible for your system for the best sound quality while still achieving full power output.

There is no correct level setting suitable for all applications as head unit preamp outputs vary. Since speakers have different power requirements to reach the same output, the level is most often needed to compensate for these differences.

#### **Protection Indicator**

This amplifier is equipped with an advanced protection system. If for any reason this unit goes into protection mode it will flash a solid single red LED light found on the control end of the amplifier.

#### **Control Panel**

The control panel can be found under the cover located on the face of the amplifier. To access the control panel remove the cover by unfastening the two screws using the included Allen key.

#### **Crossover Controls**

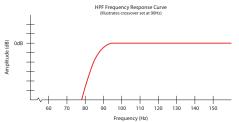

**Note**: All frequency markings are intended as guidelines only, the only way to set these dials exactly is with an oscilloscope.

A crossover is a device that removes unwanted frequencies from a speaker or amplifier and enhances the desired ones. A tweeter can easily be blown by bass frequencies if they are not

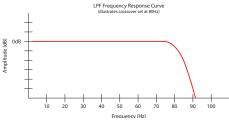

filtered out. A subwoofer will not sound natural if it is playing mid range frequencies. Careful adjustment is needed to ensure that all speakers are playing the right frequencies and that they are left with no gaps in the frequency response.

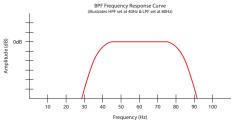

• **HPF (High-Pass Filter)** - A high-pass filter allows high frequency signals to pass through while reducing all signals lower than the cutoff frequency setting on its dial.

• LPF (Low-Pass Filter) - A low-pass filter allows low frequency signals to pass through while reducing all signals higher than the cutoff frequency setting on its dial.

• Bandpass Filter (BP) - Uses both the high-pass and low-pass filters in order to only play a selected range of frequencies.

- Subsonic A Subsonic filter allows higher frequency signals to pass through while reducing
  all signals lower than the cutoff frequency set on its dial. This allows you to remove unwanted
  frequencies in order to protect your equipment. Typically this should be set in the 30Hz range.
  Note: As an added benefit to you, all low-pass filters work in conjunction with the high-pass to
  function as a bandpass. In low-pass mode your high-pass dial functions as a subsonic filter.
  We recommend this be set around 30Hz as anything below this level is wasting battery power
  and could cause potential damage to your speaker.
- **Full** Allows the full range of frequencies to pass through.
- **Double** This setting applies the crossover settings of channels 3 and 4 to all four channels. This applies to the 600.4 amplifier only. Typically this setting is used when powering two identical speakers in bridged mode.

## Bass Boost

All of the RMA amplifiers have an adjustable bass boost. Use Bass Boost carefully - the response on the power output is tremendous!

- **600.1** The RMA Mono Amplifier includes a bass boost of 0-12dB at 45Hz. The 600.1 includes a subsonic filter that sets the lower cutoff frequency, variable from 15Hz to 55Hz.
- 500.2 The RMA 2-channel amplifier includes a bass boost of 0-12dB at 45Hz.
- **600.4** The RMA 4-channel amplifier includes a bass boost of 0-12dB at 45Hz. The bass boost only affects channels 3 & 4.
- **800.5** The RMA 5-channel amplifier includes a bass boost of 0-12dB at 45Hz. The 800.5 includes a subsonic filter that sets the lower cutoff frequency, variable from 15Hz to 55Hz. Please note the bass boost and subsonic settings will only function on CH5.

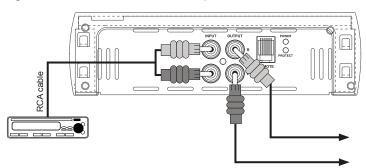

## Remote Gain Control

 The RMA 600.1, 500.2, and 800.5 Amplifiers include a remote gain control module that can be plugged into the amplifier to allow easy reduction of the gain setting without accessing the amplifier.

Remote Gain Control Module

**RCA Line Out** - The RMA 600.1, 500.2, and 500.4 amplifiers all have line out connections that allow you to connect multiple amplifiers together. The RCA pre-outs supply a full range mono signal as they are designed to feed additional subwoofer amplifiers.

## Speaker Outputs

All RMA amplifiers are equipped with a block style terminal for speaker connection. Make these connections carefully and neatly. Strip your wire back <sup>5</sup>/<sub>8</sub>" and twist the exposed leads. Insert them into the appropriate spot on the block terminal. Make sure that there are no loose or frayed strands of wire sticking out. If a wire comes in contact with another wire, the amplifier will go into protection mode. Fasten the wire in place with the small Allen hex key (included). Verify your wires are secured in place by gently pulling on them. **Note**: Know your impedance before you make any connections.

**1.** Disconnect the negative cable from the boat battery. Tape up the end so it is isolated from the battery.

**2.** Run a red 4 AWG wire from the battery to the amplifier. Plan this part of the installation carefully. This cable will carry a very high current (or battery switch common post). If it should short to any metal and is not properly fused it could catch fire.

**3.** Connect an in-line fuse holder to the power cable no further than 12" away from the positive battery terminal. If one amplifier is being used, refer to the table below for recommended fuse rating. If two or more amplifiers are being used, verify the fuse and wire are capable of handling the total current load of all amplifiers connected. To protect each amplifier, use an in-line fuse holder or fused distribution block within 18" of the amplifiers, again referring to the table below. Do not install the fuse(s) until the end of the installation.

### Please refer to the following recommended fuse ratings for your specific amplifier:

- 600.1 Amplifier 50 Amp Fuse
- 500.2 Amplifier 40 Amp Fuse
- 600.4 Amplifier 50 Amp Fuse
- 800.5 Amplifier 80 Amp Fuse

**4.** Run the black 4 AWG ground wire directly to the negative (-12V) pole on the battery. This wire should handle the load in the previous step and be as short as possible.

5. Wire your speakers and route wires to your amp mounting location.

6. Connect the power and the ground wires to the amplifier.

7. Connect the blue remote wire from the head unit to the "REMOTE" connection of the amplifier.

### \*\* Only after this step should you install the fuse at the battery\*\*

**8.** Turn on the amplifier to verify it is wired correctly and does not go into protection mode. The power LED should turn solid green after a few seconds.

**9.** Once you verify you have a steady green light please turn the amplifier off to complete the remaining connections.

10. Connect the speaker wires to the amplifier, making sure the polarity (+ and -) are correct.

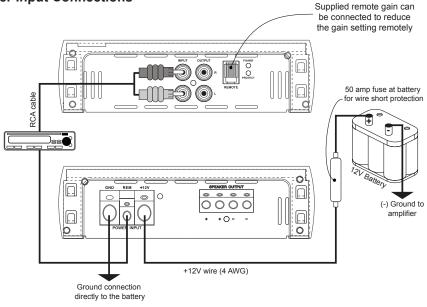

**11.** Connect the RCAs to the appropriate inputs on the amplifier.

## You must now set the controls on the amplifier.

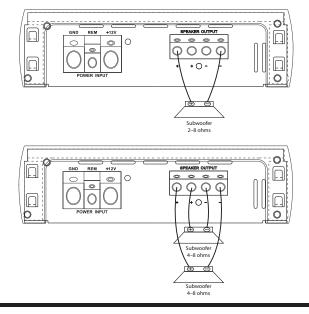

# This is the most important part of an amplifiers installation and should be completed by a trained audio professional.

## Notes

Notes

Notes

# CAUTION! RMA 600.1, 500.2, 600.4 & 800.5 Amplifiers

## AMPLIFIER MAY BECOME VERY HOT DURING NORMAL OPERATION

Your new Roswell Marine Audio amplifier possesses exceptional efficiency and thermal management. However, it is possible that, if mounted in a confined space and/or high temperature environment, it may become extremely hot during periods of extended use.

Special attention must be given during the installation process to optimize cooling efficiency. An unobstructed airflow around the amplifier's heat sink is required to enable proper cooling. For optimal performance Roswell recommends mounting the amplifier as follows:

Vertical Mount

Flat Mount

Mounting the amplifier in a position that does not enable proper cooling will affect the performance of the unit and is strongly discouraged.

## IN ADDITION TO PROPER MOUNTING, ENSURE THAT NO ITEMS ARE IN DIRECT CONTACT WITH AMPLIFIER

Life vests, wet suits, towels, coolers, and other like items must be kept away from amplifier.

Roswell Wake-Air is not liable for damage resulting from improper mounting and/or negligent use of this product.

**Warning!** Continuous exposure to sound pressure levels over 100dB may cause permanent hearing loss. High power autosound system may product sound pressure levels well over 130dB, use common sense and practice safe sound!

## ROSWELL MARINE AUDIO WARRANTY AND SERVICE GUIDELINES

Roswell Wake Air warrants all new RMA Series amplifiers against defects in material and workmanship for a period of ONE (1) YEAR from the original date of purchase. This warranty is not transferable and applies only to the original retail purchaser from an authorized Roswell Marine Audio retailer. Upon inspection by Roswell Wake Air, should service be necessary under this warranty for any reason due to manufacturer defects, Roswell Wake Air will, at our own discretion, repair or replace the defective product with new or similar conditioned product at no charge.

THIS WARRANTY DOES NOT COVER INSTALLATION OR DAMAGE RESULTING FROM ACCIDENT, MISUSE, ABUSE, IMPROPER WIRING, OPERATION OUTSIDE OF THE MANUFACTURERS RECOMMENDATIONS OR SPECIFICATIONS, OR AGAINST INSTRUCTIONS IN OWNERS MANUAL. IN ADDITION, ANY PRODUCT THAT HAS BEEN OPENED, TAMPERED WITH OR MODIFIED, OR IF ANY SERIAL NUMBERS HAVE BEEN REMOVED, WILL NOT BE COVERED BY ANY PART OF THE MANUFACTURES WARRANTY.

All warranty claims must first be made in direct contact with Roswell Wake Air's warranty department. When first contact is made the warranty representative will issue an RA # to open a claim. All warranty returns should be sent to Roswell Wake Air freight prepaid and must be accompanied by proof of purchase (a copy of original sales receipt). Direct returns from consumers or non-authorized retailers will be refused unless specifically authorized by Roswell Wake Air with a valid return authorization number (RA#).

All warranty returns should be packed in the original packaging and must be accompanied by a copy of the original sales receipt. Product damage during shipping will not be covered under this warranty. The customer or retailer may choose to have this damage repaired at the normal "Out of Warranty" repair cost.

In no event will Roswell Wake Air be liable for incidental, consequential, or other damages resulting from the use of this product. This includes but is not limited to, damage of hearing, property of person, damage based upon inconvenience or on loss of use of the product, and to the extent permitted by law, damages for personal injury.

This warranty applies to products being sold and used in the United States of America and Canada. In all other countries please contact your authorized Roswell Wake Air representative.

For warranty and non-warranty repairs, please contact Roswell Wake Air:
